ABSTRACT

A notification device comprises control software
including a calendar-type application, which is capable
of managing notification messages and where the messages
5   are associated with at least an item of notification
content and a time of notification. The method comprises
the steps of: deciding to notify a user, based at least
in part on a comparison between said time of notification
and current time, obtaining an audio signal based on the
10   item of notification content, and outputting the audio
signal through a speaker of the portable communication
device with the resulting effect of notifying the user.
